# Measurement of MPE

Reference No.: KS071115A01-RP Report No.: KS071115A01-RP

#### 1. Foreword

In adopt with the Human Exposure IEEE C95.1, and according to the FCC 1.1310. The *Maximum Permissible Exposure (MPE)* is obligated to measure in order to prove the safety of radiation harmfulness to the human body.

The *Gain* of the antenna used is measured in an anechoic chamber. The maximum total power to the antenna is to be recorded. By adopting the *Friis Transmission Formula* and the power gain of the antenna, we can find the distance right away from the product, where the limit of the MPE is.

2. Limits for Maximum Permissible Exposure (MPE)

| Limits for Maximum Fermissible Exposure (MFE) |                    |                   |                    |   |  |
|---|--------------------|-------------------|--------------------|---|--|
| Frequency                                     | Electric Field     | Magnetic Filed    | Power Density      | Averaging Time                          |  |
| Range   | Strength (V/m)     | Strength (H)      | (S)                | E  <sup>2</sup> ,  H  <sup>2</sup> or S |  |
| (MHz)   |                    | (A/m)             | (mW/cm2)           | (minutes)                               |  |
| (A) Limits for Occ                            | upational/Control  | led Exposure      |                    |   |  |

Reference No.: KS071115A01-RP Report No.: KS071115A01-RP

- DTS device is not subject to routine RF evaluation; MPE estimate is used to justify the compliance.
- 3. For mobile or fixed location transmitters, no SAR consideration applied. The maximum power density is 1.0 mW/cm<sup>2</sup> even if the calculation indicates that the power density would be larger.

#### **TEST RESULTS**

## No non-compliance noted.

### Calculation

Given

$$E = \frac{\sqrt{30 \times P \times G}}{d} \quad \& \quad S = \frac{E^2}{3770}$$

Where E = Field strength in Volts / meter

P = Power in Watts

G = Numeric antenna gain

*d* = *Distance in meters* 

*S* = Power density in milliwatts / square centimeter

Combining equations and re-arranging the terms to express the distance as a function of the remaining variables yields:

Reference No.: KS071115A01-RP Report No.: KS071115A01-RP

$$S = \frac{30 \times P \times G}{3770d^2}$$

Changing to units of mW and cm, using:

$$P(mW) = P(W) / 1000$$
 and

$$d(cm) = d(m) / 100$$

Yields

$$S = \frac{30 \times (P/1000) \times G}{3770 \times (d/100)^2} = 0.0796 \times \frac{P \times G}{d^2}$$
 Equation 1

Where d = Distance in cm

P = Power in mW

G = Numeric antenna gain

 $S = Power density in mW / cm^2$ 

## **Maximum Permissible Exposure**

EUT output power = 37.07mW

Numeric Antenna gain = 2.24

Substituting the MPE safe distance using d = 20 cm into Equation 1:

Yields

$$S = 0.000199 \times P \times G$$

Where P = Power in mW

G = Numeric antenna gain

 $S = Power density in mW / cm^2$ 

 $\rightarrow$  Power density = 0.0165mW / cm<sup>2</sup>

(For mobile or fixed location transmitters, the maximum power density is 1.0 mW/cm<sup>2</sup> even if the calculation indicates that the power density would be larger.)
